

ASX RELEASE: 23 April 2025

Kookynie Gold Project, WA – Exploration Update

ACCELERATED EXPLORATION PROGRAM UNDERWAY AT KOOKYNIIE AS REVIEW IDENTIFIES NEW TARGETS

Independent detailed review identifies numerous unexplored priority targets, adding to known areas of high-grade mineralisation

KEY HIGHLIGHTS

- An **independent technical review** of the Kookynie Gold Project, which has seen minimal modern exploration, has highlighted the significant potential upside at the Project, including:
 - **Known high-grade prospects** – such as **McTavish, Leipold and Champion** – all of which remain open in all directions and under-explored;
 - **Numerous promising structural settings and anomalous soil assays identified from a review of historical exploration data and interpretation of higher resolution magnetics and geochemistry** – all of which remain largely under-explored; and
 - **Confirmation that the historical Cosmopolitan and Altona mines, which produced 331,000 ounces at 15g/t Au¹ up to 1922 and 74,000 ounces at 30g/t² Au up to 1965 respectively³ have had little or no modern exploration and remain high-priority targets.**
- Soil and auger sampling programs have just been completed across three of the **highest priority targets** – and the three largest Kookynie tenements – identified from the review, being the **Ithaca, Wandin and Mulga Plum** prospects:
 - **Ithaca** - located ~1km directly along strike from Genesis Minerals' Orient Well Project, part of its Ulysses Operations (7.9Mt @ 3.4g/t Au⁴) – multiple historic workings and potential for Orient Well-style mineralization.
 - **Wandin** - several gold anomalies of up to 230ppb Au identified from 2024 auger sampling, with in-fill auger sampling currently underway.
 - **Mulga Plum** - located at the western end of the historical Niagara and Kookynie Goldfields within the Malcolm greenstone belt – soil sampling underway targeting structural features and around historical drilling results from Ardea Resources Limited, which previously returned 2m @ 8.84 g/t Au from 14m (AJAR0009)⁵.
- Initial assays from the above soil and auger programs are anticipated in the coming weeks with drilling expected to follow at high priority targets.
- Drilling at the Yundamindra Gold Project expected to re-commence shortly.

⁵ Refer to Arika ASX Announcement "Continued Consolidation of Area Around Kookynie Gold Project" dated 23 November 2020

Arika Resources Limited (ASX: ARI) (“Arika” or “Company”) is pleased to report encouraging initial outcomes from the first phase of an independent technical review of its 80% owned **Kookynie Gold Project** (20% Nex Metals (ASX: NME)), located 180km north of Kalgoorlie in the world-class Eastern Goldfields mining district of Western Australia.

Following several years of reduced activity and with its recent focus on the Yundamindra Gold Project, the Company commissioned an independent review of the Kookynie Gold Project by an experienced technical consultant. The focus of the review was to independently evaluate the prospectivity of the Kookynie Project, identify the highest priority targets and plan the next phases of exploration.

Like Yundamindra, the Kookynie Gold Project has significant gold endowment but has seen minimal modern exploration over the ~110km² of tenure.

Initial exploration by Arika from 2019 to 2021 largely focused on the known mineralisation at the McTavish, Leipold and Champion deposits, all located on granted Mining Leases, with over 30,000m of completed drilling at the time which produced some outstanding results, including ⁶:

- **10m @ 7.44 g/t Au** from 108m (LPRC0049)
- **9m @ 7.91 g/t Au** from 34m (LPRC0001)
- **8m @ 9.33 g/t Au** from 97m (LPRC0051)
- **6m @ 9.4 g/t Au** from 26m (LPRC0003)
- **5m @ 17.9 g/t Au** from 48m (McTRC0005)
- **4m @ 26.91 g/t Au** from 65m (LPRC0077)
- **4m @ 16.3 g/t Au** from 42m (LPRC0012)

Feedback from the independent review has been very encouraging, with the Kookynie Project viewed either as substantially unexplored or under-explored, with strong potential for new discoveries undercover – such as the recent nearby Swiftsure discovery by Carnavale Resources Limited⁷ – and for resource growth at the existing prospects, including Leipold, McTavish and Champion.

The pipeline of exploration opportunities is significant, including the greenfield opportunities set out above and below, together with the historical Cosmopolitan and Altona mines – which produced 331,000 ounces at 15g/t Au¹ up to 1922 and 74,000 ounces at 30g/t² Au up to 1965 respectively but have also have seen little or no modern exploration and which Arika will seek to rectify over the coming period.

Arika’s Managing Director, Justin Barton, said:

***“The Kookynie Gold Project has become somewhat of a forgotten project in our portfolio given our recent focus at Yundamindra – which continues to emerge as a large-scale discovery and growth opportunity. Despite this, Kookynie shares many similarities with Yundaminda in that it was a significant historical producer in the early 1900’s, has seen virtually no modern exploration, and remains highly prospective for a new generation of discoveries.*”**

***“Previous drilling by Arika returned numerous high-grade results – with most of this early drilling focused on the known mineralisation at the McTavish, Leipold and Champion prospects, which remain open along strike and at depth. Given the success of the early drilling, no greenfield exploration was undertaken across a large portion of the undercover tenure.*”**

***“Following the independent review, a number of new priority targets have been identified such as the Ithaca prospect, which sits just ~1km along strike from Genesis Minerals’ Orient Well Project. This has prompted us to accelerate exploration activities, with detailed soil and auger programs underway over three of the highest priority areas. We look forward to receiving the results of this program and refining our target pipeline for upcoming drill testing, in parallel with ongoing work at Yundamindra.”*”**

⁶ Refer to Arika ASX Announcements “Kookynie Gold Drill Hole Intercepts” dated 21 January 2020, “Spectacular High Grade Results from First Assays at Kookynie” dated 25 June 2020, “Kookynie Leipold Continues to Deliver Outstanding Results” dated 25 August 2020 and “Assays up to 118 g/t Au from Leipold, Kookynie Gold Project” dated 3 May 2021.

⁷ Refer to Carnavale ASX Announcement “Robust Maiden Resource and Positive Scoping Study Kookynie” dated 13 June 2024 (ASX: CAV)

Kookynie Gold Project Review

The Kookynie Gold Project is located approximately 180km north of the town of Kalgoorlie and represents an opportunity to discover high-grade gold deposits by leveraging off historical and recent exploration within the area undertaken by Arika and past explorers.

The Kookynie Project hosts some of Arika's key gold assets, which include the historical mining centres of Diamantina-Cosmopolitan-Cumberland (known as the "DCC trend"), as well as the McTavish, Leipold, Champion and Altona prospects (Figure 1). These key prospects all have shallow mineralisation, are all located on granted Mining Leases and are all situated in close proximity to a number of gold processing mills easily accessible by road, providing a unique opportunity for the Company to unlock significant value.

Figure 1: Kookynie Gold Project Location Map

As part of the Company's strategy to advance the Kookynie Gold Project in conjunction with the Yundamindra Gold Project, the Company commissioned an independent technical review of the Kookynie Project in December 2024. The initial feedback from the review of the Kookynie Gold Project, has identified and highlighted several opportunities for the Company, including:

- **Known Mineralisation:** Known high-grade prospects, including McTavish, Leipold and Champion all remain open in all directions and under-explored;
- **New discoveries undercover:** A review of historical exploration data and interpretation of higher resolution magnetics and geochemistry has identified a multitude of promising structural settings and anomalous soil assays that remain largely untested by systematic shallow drilling; and
- **Historical Mines:** The Cosmopolitan and Altona mines, which produced 331,000 ounces at 15g/t Au¹ up to 1922 and 74,000 ounces at 30g/t² Au up to 1965 respectively, have had little or no systematic drilling at depth or along strike.

The first phase of the review has focused on reviewing all historical data and interpreting magnetics and geochemistry to identify structural settings and anomalous soil assays on the under-explored and unexplored areas of the project.

This has identified several high-priority targets, with three key areas being the Ithaca prospect, the Wandin prospect and the Mulga Plum prospect.

These are discussed in further detail below.

The Ithaca Prospect

The Ithaca prospect is located at the northern end of the Kookynie Project (Figure 1), ~1km along strike from Genesis Minerals' Orient Well Project, part of its Ulysses Operations.

Arika has not previously conducted any exploration on this tenement, however the review indicated that numerous gold targets remain untested. The tenement has exposed residual saprolite and areas of shallow alluvium cover. Several historical small mines, prospecting shafts, pits and costeans are still exposed.

Most modern exploration on this prospect was cursory or first-pass, site specific gold exploration in the 1980's.

Ithaca has the potential to host both Orient Well and Orient Well NW style gold mineralisation. The host lithologies of Orient Well and Orient Well NW as well as the host structures have been interpreted to persist into the Ithaca prospect. All these styles of gold mineralisation are associated with quartz veining plus silica - sericite and pyrite alteration of the generally felsic host rocks.

Importantly, all of these styles are known to host substantial remaining mineable gold resources e.g. the Orient Well deposit (5.44Mt @ 1.1g/t Au for 189koz) and the newly discovered Orient Well NW deposit (0.6Mt @ 1.2g/t Au for 23,000 oz) – both using a 0.5 g/t Au cut-off (Genesis March 2021)⁸. Both of these deposits are open and have not been closed off in recent drilling by Genesis.

More recent explorers acquired higher resolution magnetics over part of the tenement, however, no follow-up was initiated. This high-resolution magnetic data has now helped to identify new untested targets.

Commencing in late March 2025, a total of 996 x -2mm soil were collected and dispatched to LabWest for Ultrafine analysis (Au and 52 multi-elements) (Figure 2). It is expected that these results will be available by late April or early May and may show zones of coherent gold and possibly pathfinder anomalism that will guide potential follow-up air-core or RC drilling later in 2025.

⁸ Refer Geneses Minerals Limited (GMD) ASX Announcement "Ulysses Mineral Resource Increase to 1.6 Million Ounces" dated 29 March 2021

Figure 2: Ithaca prospect soils program, showing proximity to Genesis Orient Well operations.

The Wandin Prospect

The surface of E40/390 (the Wandin prospect) has no exposed bedrock and is covered by residual and thin transported soils. There are no obvious gold workings at Wandin however the local area, particularly east of the tenement, has many historical gold workings due to less or minimal soil cover.

The historical workings in the Kookynie area are structurally controlled against variable lithologies or within the same host rock. Many structures are interpreted from the airborne magnetics but are essentially untested.

In the last 30 years, the area covered by E40/390 has had variable surface sampling, minor reconnaissance RC drilling and minor selective RAB drilling and higher resolution airborne magnetics.

In 2024, Arika conducted systematic 200m x 200m spaced +2 – 6mm Auger sampling with Au and multi-element 4 acid digest ICP analysis (Au: FA with 5ppb DL), which essentially covered the tenement (Figure 3).

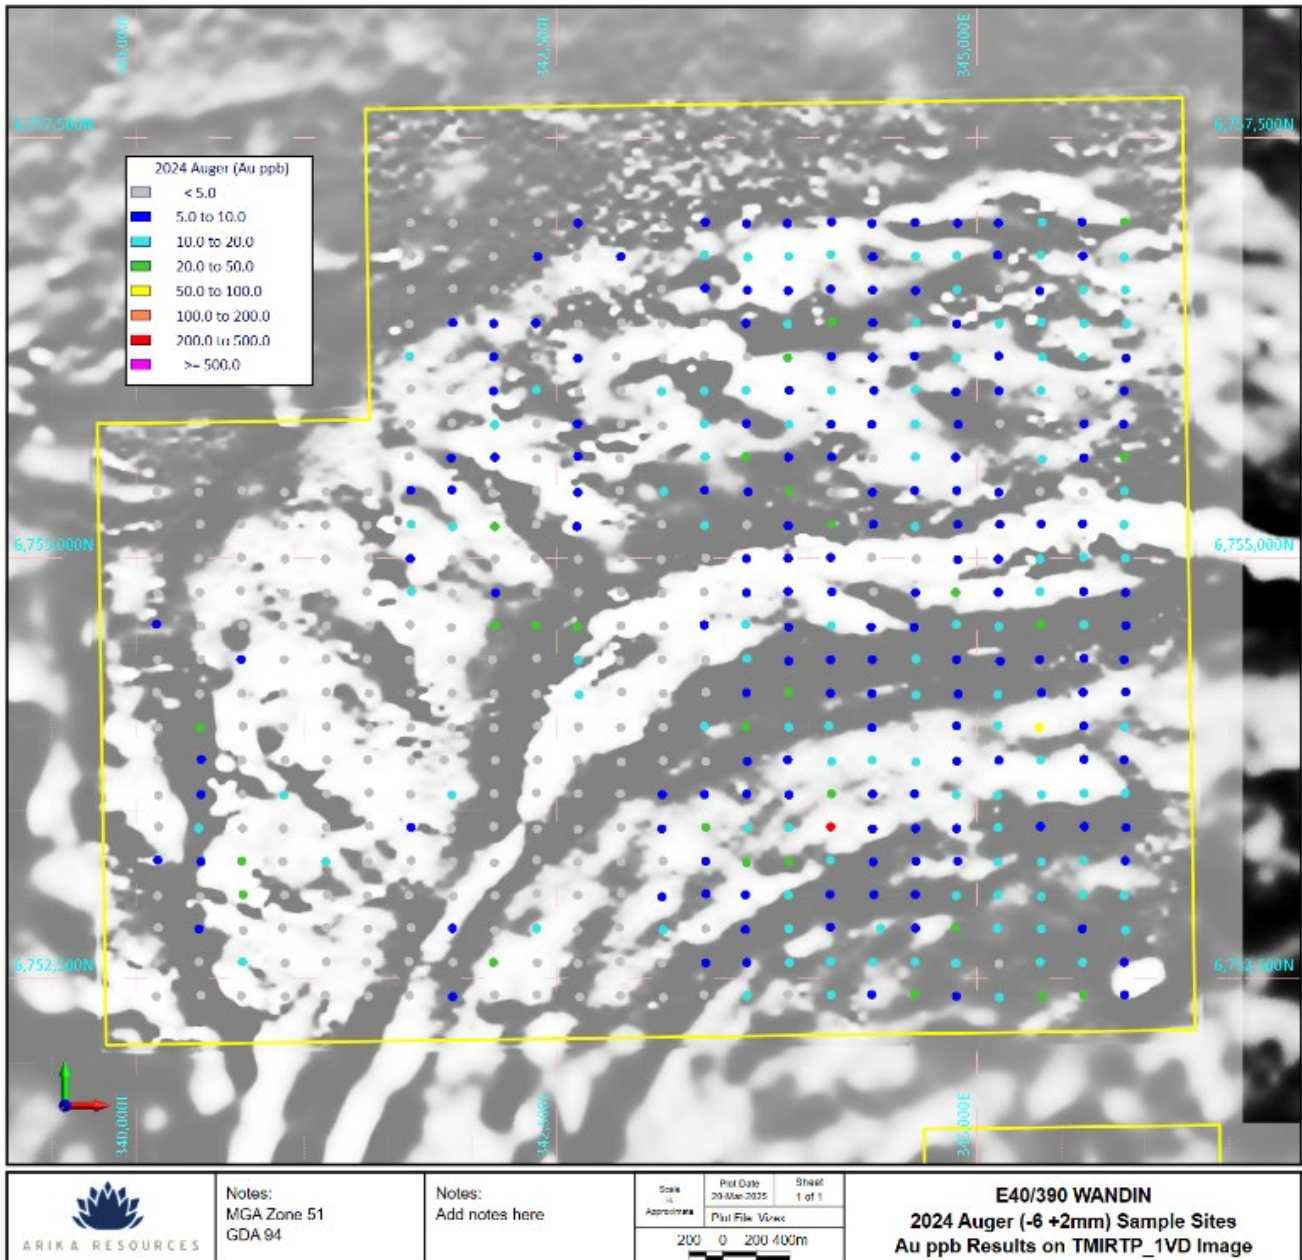

Figure 3: Arika 2024 Soils Program, with anomalous gold sample locations, with best result of 230ppb Au.

Several gold anomalies were highlighted even in areas that were previously soil or lag sampled, with a best result of 230ppb Au returned.

A summary of soil locations and results for all holes are presented in Appendix 1, Table 1.

A review of the results in conjunction with consultant geochemist Steve Sugden, including on-site ground truthing, indicated that the Auger technique and assay methodology accurately reflected the interpreted bedrock geology from the magnetics data.

A 1055 auger sample program has commenced (Figure 4) to tighten-up sample spacing based upon the orientation of the existing geochemical anomalism in sympathy with interpretation of the airborne magnetics features.

It is anticipated that results will be returned in the coming weeks, with the results to guide potential follow-up air-core or RC drill testing.

Figure 4: Auger program recently completed at Wandin prospect.

The Mulga Plum Prospect

The Mulga Plum prospect area is located at the western end of the Niagara and Kookynie Goldfields within the Malcolm greenstone belt. This prospect remains unexplored by Arika, however shallow 1,500m RC drilling targeting gold mineralisation was conducted around the historical Mulga Plum gold workings by Ardea Resources in 2019. Significant intercepts returned by Ardea included⁹:

- 2m @ 8.84 g/t Au from 14m (AJAR0009)
- 6m @ 1.22 g/t Au from 10m (AJAR 0011)
- 2m @ 2.96 g/t Au from 42m (AJAR0003) and
- 2m @ 1.25 g/t Au from 38m (AJAR007)

⁹ Refer to Arika ASX Announcement "Continued Consolidation of Area Around Kookynie Gold Project" dated 23 November 2020

Interpretation of the regional aeromagnetics indicates numerous structural features, some of these are in same orientations as observed further east in the Niagara line of gold workings or elsewhere in the Kookynie district and almost all of these are untested.

A total of 782 sites were planned for -2mm sieved fraction sampling on variable spaced traverses and sample spacing to test various interpreted features on the magnetics data (Figure 5). The samples have now been collected and dispatched to laboratories for testing, with results anticipate in the coming weeks

Figure 5: Mulga Plum Soil Sampling locations

Kookynie Gold Project

The Kookynie Gold Project is located in the highly endowed Leonora Laverton area (Figure 6) and presents an opportunity to develop a high-grade gold resource based off historical and recent exploration within the area undertaken by Arika and past explorers.

The Kookynie Project hosts some of Arika's key gold assets, which include the historical mining centres of Diamantina-Cosmopolitan-Cumberland (known as the "DCC trend"), as well as the McTavish, Leipold, Champion and Altona prospects.

These key prospects all have shallow mineralisation, are all located on mining leases and are all situated in close proximity to a number of gold processing mills easily accessible by road, providing a unique opportunity for the Company to unlock significant value.

The Kookynie Gold Project has significant historical and current gold endowment, with the Cosmopolitan Gold Mine producing more than 331,000 ounces between 1895 and 1922 at an average grade of 15g/t Au. The Altona Gold Mine produced 88,700 ounces between 1900 and 1965 at an average head grade of 30g/t Au.

Arika has drilled 380 holes for over 34,000 metres across several deposits, prospects and exploration targets within the Kookynie Gold project since early 2020. This volume of drilling has yielded significant intercepts, with some truly spectacular gold results including, but not limited to:

Arika's exploration activities to date have proved that the Kookynie Gold Project has substantial value and the Kookynie area retains significant mineral endowment.

In April 2022, Arika released a maiden JORC 2012 Mineral Resource Estimate for the Leipold, McTavish and Champion Deposits totalling 83,000 ounces of contained gold.

Please refer to Table 2 for the Total Mineral Resource Estimate Breakdown (ref):

Kookynie Gold Project									
March 2022 Mineral Resource Estimate (0.5g/t Au Cut-off)									
Deposit	Indicated			Inferred			Total		
	Tonnage kt	Au g/t	Au Ounces	Tonnage kt	Au g/t	Au Ounces	Tonnage kt	Au g/t	Au Ounces
Leipold	450	1.3	19,000	630	1.7	34,000	1,080	1.5	53,000
Champion				380	1.7	20,000	380	1.7	20,000
McTavish				120	2.0	8,000	120	2.0	8,000
Total	450	1.3	19,000	1,130	1.7	62,000	1,580	1.6	81,000

Table 2 – Kookynie Mineral Resource Estimate Tables.¹⁰

Significant resource upside potential remains at the Kookynie Project, with all prospects open along strike and at depth, and the McTavish South, Cosmopolitan and Altona prospects still to be drilled.

¹⁰ Complete details of the Kookynie Mineral Resources (McTavish, Champion and Leipold deposits) (1.58Mt @ 1.6 g/t Au for 81,000 oz Au) and the associated Competent Persons Statement were published in the ASX Announcement "Kookynie Maiden JORC 2012 Mineral Resource Estimate" by ARI (previously MCT) dated 1st April 2022. Arika Resources Limited reports that it is not aware of any new information or data that materially affects the information included in that Mineral Resource announcement and that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and there have been no adverse material changes.

Much of the bedrock geology of interest within the Company's tenure at Kookynie is obscured beneath thin transported and/or residual soil cover and has received little previous exploration. The McTavish East Gold Deposit, a completely 'blind' deposit discovered by Carnavale Resources (ASX: CAV) ~1km south-east of Arika's McTavish Prospect, provides compelling evidence that significant gold mineralisation is still to be found at Kookynie.

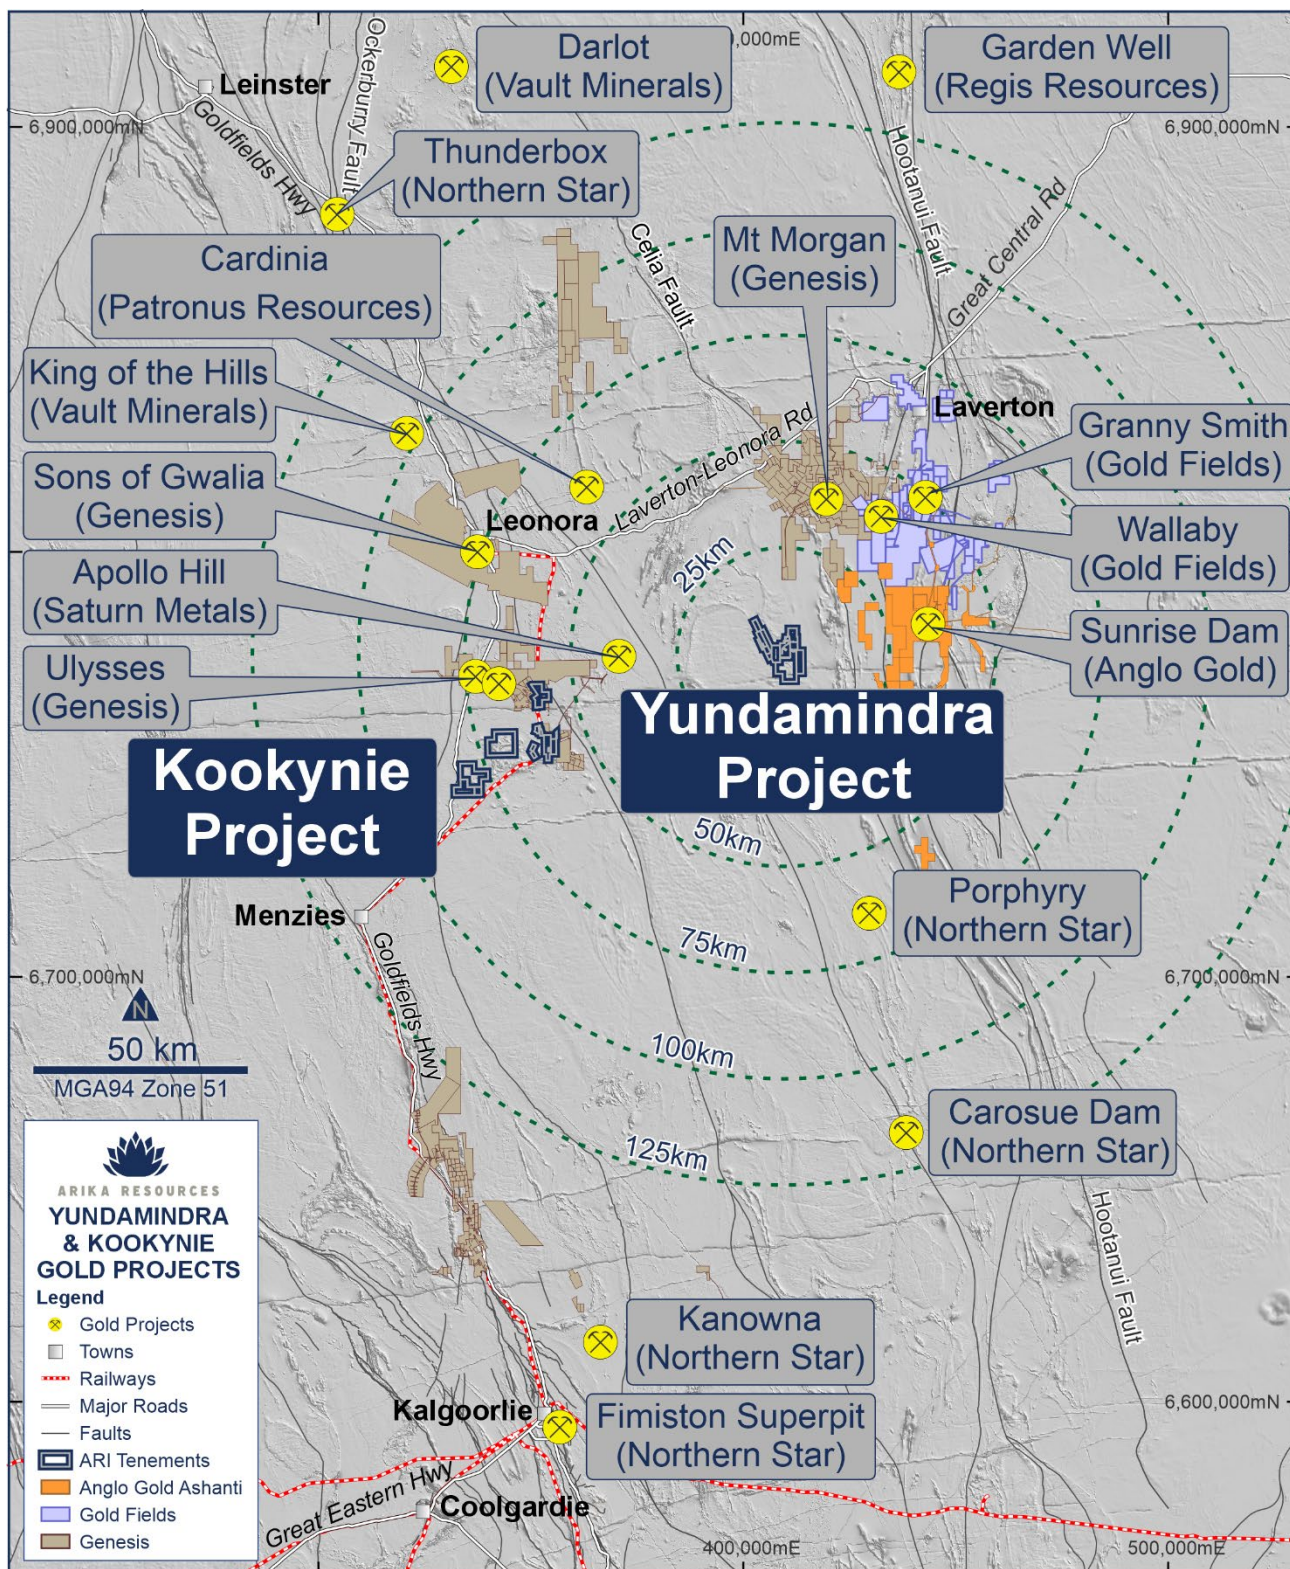

Figure 6: Regional Location Plan showing proximity of Yundamindra to Major Deposits, Mines and Processing Facilities.

Next Steps

Kookynie

- Await assay results from Ithaca area, Mulga Plum area soil sampling and Wandin area auger sampling in the coming weeks.
- Interpretation of these results will guide and prioritise targets for drill testing during Q2/3 CY2025.
- Continue detailed review of the Kookynie Project, including Leipold, McTavish, Champion, Cosmopolitan and Altona for targeting of extensional RC drilling.

This announcement is approved by the Board of Arika Resources Limited.

Competent Person Statement

The information that relates to Exploration Results is based upon information compiled by Mr Steve Vallance, who is a consultant to Arika Resources Ltd. Mr Vallance is a Member of The Australian Institute of Geoscientists (AIG). Mr Vallance has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code 2012). Mr Vallance consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Forward-Looking Statements

This announcement may contain certain "forward-looking statements" which may not have been based solely on historical facts but rather may be based on the Company's current expectations about future events and results. Where the Company expresses or implies an expectation or belief as to future events or results, such expectation or belief is expressed in good faith and believed to have reasonable basis. However, forward-looking statements:

- are necessarily based upon a number of estimates and assumptions that, while considered reasonable by the Company, are inherently subject to significant technical, business, economic, competitive, political and social uncertainties and contingencies.
- involve known and unknown risks and uncertainties that could cause actual events or results to differ materially from estimated or anticipated events or results reflected in such forward-looking statements. Such risks include, without limitation, resource risk, metals price volatility, currency fluctuations, increased production costs and variances in ore grade or recovery rates from those assumed in mining plans, as well as political and operational risks in the countries and states in which the Company operates or supplies or sells product to, and governmental regulation and judicial outcomes; and
- may include, among other things, statements regarding estimates and assumptions in respect of prices, costs, results and capital expenditure, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions.

The words “believe”, “expect”, “anticipate”, “indicate”, “contemplate”, “target”, “plan”, “intends”, “continue”, “budget”, “estimate”, “may”, “will”, “schedule” and similar expressions identify forward-looking statements.

All forward-looking statements contained in this presentation are qualified by the foregoing cautionary statements. Recipients are cautioned that forward-looking statements are not guarantees of future performance and accordingly recipients are cautioned not to put undue reliance on forward-looking statements due to the inherent uncertainty therein.

The Company disclaims any intent or obligation to publicly update any forward-looking statements, whether as a result of new information, future events or results or otherwise.

No New Information

To the extent that this announcement contains references to prior exploration results which have been cross referenced to previous market announcements made by the Company, unless explicitly stated, no new information is contained. The Company confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements and, in the case of estimates of Mineral Resources, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed.

Cautionary Statement

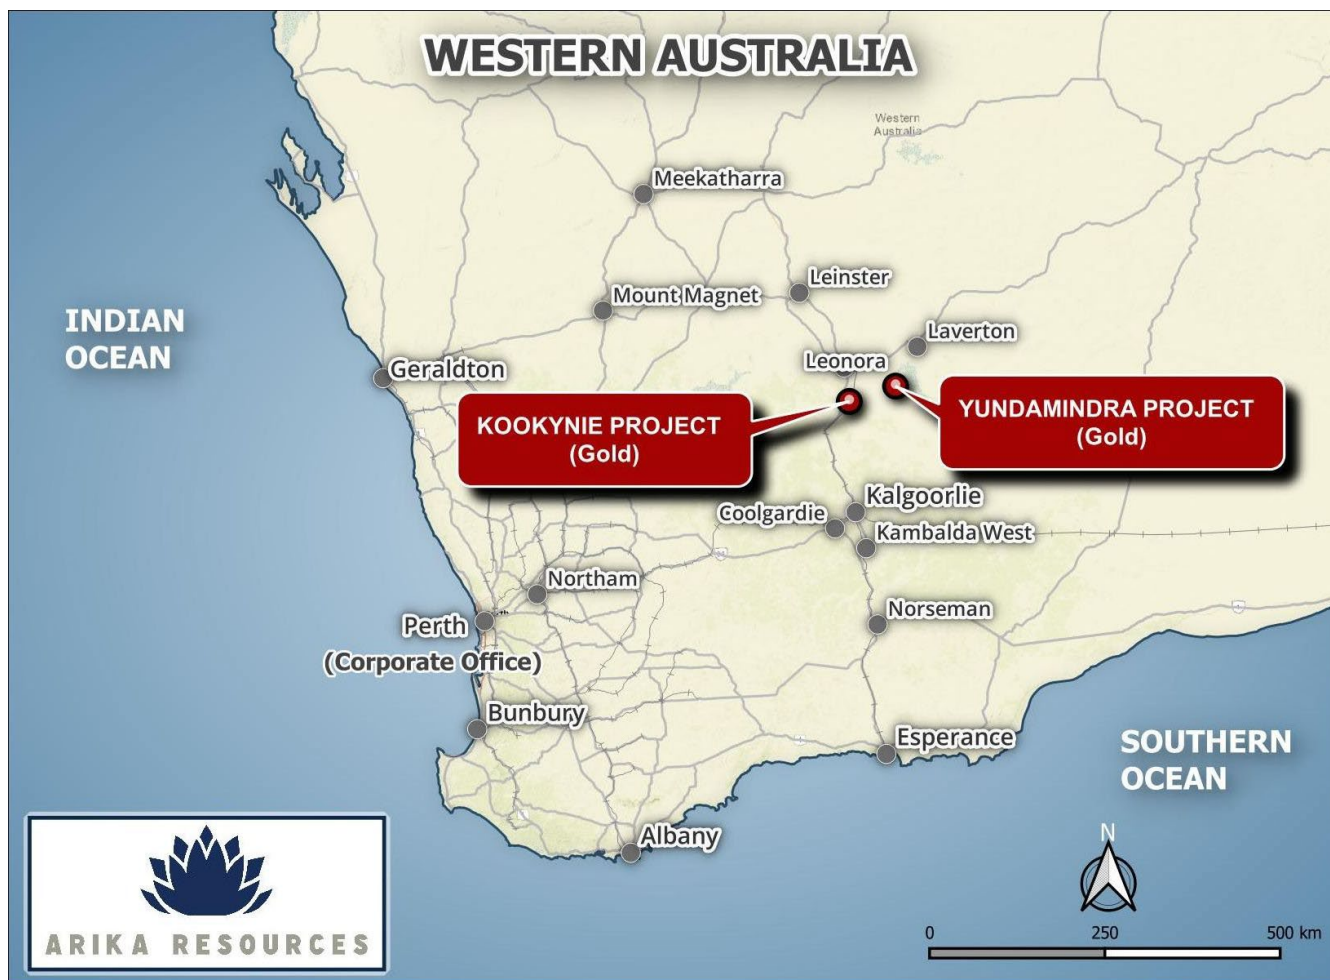

The Production details for the Altona and Cosmopolitan are referenced from publicly available data sources. The source and date of the production data reported has been referenced in the body of this announcement where production data has been reported. The historical production data have not been reported in accordance with the JORC Code 2012. A Competent Person has not done sufficient work to disclose the historical production data in accordance with the JORC Code 2012. It is possible that following further evaluation and/or exploration work that the confidence in the prior reported production data may be reduced when reported under the JORC Code 2012. Nothing has come to the attention of the Company that causes it to question the accuracy or reliability of the historical production data, and an assessment of the additional exploration or evaluation work that is required to report the data in accordance with JORC Code 2012 will be undertaken as part of the Company’s development plan.

About Arika Resources Limited

We are focused on delivering value to shareholders through the discovery and development of high-quality gold assets, including its 80% owned Kookynie and Yundamindra Gold Projects (20% owned by Nex Metals (ASX: NME)), in Western Australia.

Arika Resources Limited is continuing to build on the potential large-scale gold footprints at the Yundamindra and Kookynie Gold Projects by expanding on known mineralisation and targeting new discoveries through a pipeline of high priority brownfield and greenfield targets.

Section 1: Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<ul style="list-style-type: none"> • Results reported in this announcement relate to 528 samples recovered from Auger Drilling on E40/390 Wandin prospect area conducted in June 2024.
<i>Drilling techniques</i>	<ul style="list-style-type: none"> • <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i> 	<ul style="list-style-type: none"> • All Auger drilling was conducted by Gyro Australia Pty Ltd, Kalgoorlie, WA. • Auger holes were drilled generally to refusal, which averaged 0.5m in the area.
<i>Drill sample recovery</i>	<ul style="list-style-type: none"> • <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> • <i>Measures taken to maximise sample recovery and ensure representative nature of the</i> 	<ul style="list-style-type: none"> • All sample material was collected at Refusal Depth. • No further measures to maximise sample recovery are applicable.

	<p><i>samples.</i></p> <ul style="list-style-type: none"> • <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> 	<ul style="list-style-type: none"> • N/A as sufficient material is collected by sub-sampling to a designated size fraction, see below.
<i>Logging</i>	<ul style="list-style-type: none"> • <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<ul style="list-style-type: none"> • A brief note (sample depth & colour of material) for each site was also recorded.
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<ul style="list-style-type: none"> • Samples of sieved fraction -6mm +2mm of approximately 300g were collected from refusal depth. These were placed in packets labelled with Sample ID. The Sample ID were cross-referenced with GPS sample location MGA Zone 51 GDA 94 coordinates recorded in the field. This information was subsequently exported to company's database and matched with sample results from the laboratory. • No field duplicate samples were prepared. • No standards were inserted.
<i>Quality of assay data and laboratory tests</i>	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (eg standards,</i> 	<ul style="list-style-type: none"> • Geochemical analysis was undertaken by Intertek Genalysis in Perth. The samples underwent routine pulverisation/milling to 80% <75 microns then routine multielement analysis by FA50/OE04 and 4A/MS48 • This near-full digest is considered sufficient for this stage of exploration and the weathered nature of the samples. • Gold analysis was undertaken with 50-gram Fire Assay with OES finish. The detection limit for gold via this method is 5ppb (0.005ppm). • Laboratory QA/QC involves the use of internal lab standards using certified reference material, blanks, splits and replicates as part of the inhouse procedures.

	<p><i>blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i></p>	<p>QC results (blanks, duplicates, standards) were in line with commercial procedures, reproducibility and accuracy.</p> <ul style="list-style-type: none"> Multi-Element analyses were carried out combining a four-acid digestion with ICP-MS instrumentation. A four-acid digest is performed on 0.25g of sample to quantitatively dissolve most geological materials. Analytical analysis performed with a combination of ICP-OES & ICP-MS. Element analyses include: Ag, Al, As, Ba, Be, Bi, Ca, Cd, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb, Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn, and Zr. The analytical method employed is appropriate for the styles of mineralisation and target commodity present. No geophysical tools, spectrometers, handheld XRF instruments were used. QAQC analysis shows that the lab performed within the specifications of the QAQC protocols. No external laboratory checks have been completed.
<p><i>Verification of sampling and assaying</i></p>	<ul style="list-style-type: none"> <i>The verification of significant intersections by either independent or alternative company personnel.</i> <i>The use of twinned holes.</i> <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> No umpire analysis has been performed. No twinned auger holes were drilled Field data is captured digitally. Field data is delivered electronically to the Company's Database Manager, ERM Technical Mining Services (formerly CSA Global), Perth and stored digitally.
<p><i>Location of data points</i></p>	<ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> Sample locations were based upon dual GPS control. Grid system datum is GDA94 MGA Zone 51 grid Sample location points are of sufficient accuracy given the reconnaissance nature of the exploration being undertaken.
<p><i>Data spacing and distribution</i></p>	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> Auger samples were collected on an area-scale 200m x 200m grid pattern. Auger sampling will not be used in resource estimation. The sampling was aimed to identify geochemical anomalism.

<p><i>Orientation of data in relation to geological structure</i></p>	<ul style="list-style-type: none"> • <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> • <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> • The sampling pattern and sample collection methodology is unbiased to interpreted underlying geological strata or structures. • The primary aim is to define any zones of geochemical anomalism and to validate that the sampling technique is grossly reflective of interpreted basement geology.
<p><i>Sample security</i></p>	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	<ul style="list-style-type: none"> • Samples were collected by Gyro Australia field personnel with specified -6mm+2mm sieved portion placed in packets with Sample ID's directly labelled. These were delivered directly to Intertek Laboratory in Kalgoorlie in polyweave sacks secured by plastic cable ties.
<p><i>Audits or reviews</i></p>	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> • Sugden Geoscience has reviewed the results of the data and concluded that the multi-element data are reflective of basement geology and sampling technique and multi-element assays techniques are appropriate. • Sugden recommended that a lower detection Au technique should be applied in the future, but for this survey indicated that the Detection Limit was sufficient in highlighting gold anomalous zones. The gold anomalies are worthy of further follow up. • QA/QC data has been explicitly reviewed by Arika's Database Manager ERM Technical Mining Service's and by ARI in-house technical staff, and results provide a high-level of confidence in the assay data.

Appendix Two – Soil Samples Identification, Location and Results Table

Table: Soil Sample Identification, Location and Results referenced in this announcement.
